AKRPT Repeater

The AKRPT Airkey repeater is ideally suited for applications where extended range is required for ordinary hand held Airkey transmitters. Each repeater can pass-on an Airkey transmission or another repeater's transmission to ensure the original Airkey signal is received at the destination receiver. Application examples include car park duress systems where several repeaters can be used to cover a large area while only requiring a single central Airkey receiver.

Features:

- Can be used with all Airkey formats simultaneously.
- Fully automatic operation does not require any initial user configuration.
- In-built data inspection ensures any original transmission is only passed-on once per button press.
- High power SAW locked transmitter ensures the repeated signal can be received by any Airkey receiver at least 50 metres away.
 - 5-12 Volt, 10-milliamp-power consumption allows for battery backed solar power installations.

Applications:

- Garage doors, automatic gates.
- Remote arming and disarming of security
